

AIR CONDITIONER

5

ABSTRACT OF THE DISCLOSURE

10 The air conditioning case (11) includes: a right and  
a left case body (112, 111) made of resin; and a  
partitioning plate (113) made of metal, and the  
partitioning plate (113) is a partitioning portion for  
partitioning the face blowout opening portion (15) and  
the defroster blowout opening portion (16) which are  
15 formed into one opening portion by the right and the left  
case body (112, 111). Accordingly, compared with the  
partitioning portion formed integrally with the right and  
the left case body, no dividing face is formed at the  
center, and rigidity can be enhanced. Due to the above  
20 structure, it is difficult for the partitioning portion  
to be deformed, and the partitioning portion seldom  
interferes with the blowout mode door (22).
